# A COMPLEX PREDATOR THE BEHAVIOR AND ECOLOGY OF SHARKS IN THE NORTHEAST PACIFIC

**TAYLOR CHAPPLE**  
Oregon State University

Sharks are often demonized as mindless predators. But, in reality, sharks are complex – undertaking extensive migrations, exhibiting intricate behaviors, and maintaining marine systems, especially here in the northeast Pacific. Sharks help to maintain the stability of the systems humans depend upon for food, recreation, and production. I will be talking about my lab's work to understand shark behavior, movements, and physiology and the role they play in the northeast Pacific and beyond.
